AB The substitution of the sterically hindered carbon of the potent thyroid hormone agonist, GC-1, was effected by a reaction based on the solvolysis of the benzylic hydroxyl group. The reaction was found to proceed in high yield with a variety of nucleophiles including alcs., thiols, allyl silanes and electron-rich arom. compds., providing a convenient route to the synthesis of new thyroid hormone analogs.

AB Thyroid hormones regulate many different physiol. processes in different tissues in vertebrates. Most of the actions of thyroid hormones are mediated by the thyroid hormone receptor (TR), which is a member of the nuclear receptor superfamily of ligand-activated transcription regulators.
There are two different genes that encode two different TRs, TR.alpha. and
TR.beta., and these two TRs are often co-expressed at different levels in different tissues. Most thyroid hormones do not discriminate between the two TRs and bind both with similar affinities. The authors have designed and synthesized a thyroid hormone analog that has high affinity for the

TRs and is selective in both binding and activation functions for TR.beta.
over TR.alpha.. The compd., GC-1, was initially designed to solve synthetic problems that limit thyroid hormone analog prepn., and contains several structural changes with respect to the natural hormone 3,5,3'-triiodo-L-thyronine (T3). These changes include replacement of the three iodines with Me and iso-Pr groups, replacement of the biaryl ether linkage with a methylene linkage, and replacement of the amino-acid sidechain with an oxyacetic-acid sidechain. The result of this study show that GC-1 is a member of a new class of thyromimetic compds. that are more synthetically accessible than traditional thyromimetics and have potentially useful receptor binding and activation properties. The TR.beta. selectivity of GC-1 is particularly interesting and suggests that GC-1 might be a useful in vivo probe for studying the physiol. roles of the different thyroid hormone receptor isoforms.

OS CASREACT 127:293323; CJACS

AB Reactions of 4'-CF3C6F4OC6F4Li, generated in situ, with elements of group 16 (S, Se, Te) lead to CF3C6F4OC6F4SH (2), (CF3C6F4OC6F4Se)2 (3), and (CF3C6F4OC6F3Te)2 (4)/(CF3C6F4OC6F3)2Te (4a). The phenol deriv. CF3C6F4OC6F4OH (1) is obtained by reaction of CF3C6F4OC6F4Li with B(OMe)3/H2O2. The reaction of CF3C6F4OC6F4Li with trimethylsilyl chloride or trimethyltin chloride gives CF3C6F4OC6F4XMe3 (X = Si (5), Sn (6)). Oxidn. of 2 in the presence of bromine results in the formation of (CF3C6F4OC6F4S)2 (7) and CF3C6F4OC6F4SO2Br (8). Mixed perfluoroaryloxo/thio ethers CF3C6F4OC6F4SC6F4R (R = NO2 (9), CN (10), CF3 (11)) and CF3C6F4OC6F4SC5F4N (12) are obtained upon reaction of 2 with excess C6F5R and pentafluoropyridine in the presence of K2CO3. With 4-C6F5OC6F4NO2, a mixt. of (2-CF3C6F4OC6F4S)(4-C6F5O)C6F3NO2 (13) and 9 is formed. Reaction of excess 2 with C6F5R gives the 2,4,6-substituted benzenes (CF3C6F4OC6F4S)3C6F2R (R = NO2 (14), CN (15)). The trimethylsilyl ether CF3C6F4OC6F4OSiMe3 (16) is prepd. from the reaction of 1 with hexamethyldisilazane. 16 Is a convenient reagent for the prepn. of the aryl ethers CF3C6F4OC6F4OC6F4R (R = NO2 (17), CN (18)) and CF3C6F4OC6F4OC5F4N (19) upon reaction with C6F5R and C5F5N. The secondary alcs. CF3C6F4OC6F4CH(C6H5)OH (20) and CF3C6F4OC6F4CH(C6F5)OH (21) are synthesized by the reactions of 5 with benzaldehyde and

pentafluorobenzaldehyde in the presence of tetrabutylammonium fluoride as a catalyst. In the synthesis of 21 the byproduct CF3C6F4OC6F4CH(C6F5)OC6F4CHO is also formed and isolated.

AB Naphthalene derivs. [I; R = substituent; R1, R2 = alkyl, one of R3 and R4 is H, alkoxy, the other is alkoxy; n = 0-3], useful as hypolipidemic agents (no data), are prepd. by cyclocondensation of benzaldehyde derivs II (R5 = protecting group) with R1O2CC.tplbond.CCO2R2 followed by optional salt formation. A mixt. of benzaldehyde deriv. III (prepn. given) and MeO2CC.tplbond.CCO2Me in CF3CO2H and C6H6 was heated at 60.degree. to give 77% I [Rn = 6,7,8-(MeO)3, R1 = R2 = Me; R3 = R4 = MeO]. Also prepd. was 22 addnl. I.

AB A general method for the generation of isobenzofuran intermediates is described. Lithiated arom. acetals are converted to hydroxy acetals I (R = substituted Ph, R1-R4 = H, OMe, R2R3 = OCH2O), which are cyclized to isobenzofurans by mild acid treatment through the hydroxyphthalans II (R5 = H, Me). The isobenzofurans generated in situ are trapped by a variety of dienophiles to give the oxabicyclo adducts, e.g., III. The mass spectra and NMR spectra of II and III are discussed.

AB C6F5MgCl reacted with S to give C6F5SMgCl, which reacted with RCH2OMgBr (R = Ph, 3,4-Cl2C6H3, .alpha.-naphthyl) and HCO2Et to give 45-55% RCH2SC6F5 (I). I were oxidized with 30% H2O2 to yield 88-98% RCH2SO2C6F5. The analogous reaction of C6F5CHROMgCl [R = Ph, 4-ClC6H4, 4-BrC6H4, 2,4-Cl2C6H3, 3,4-(MeO)2C6H3] (from C6F5MgCl and RCHO) gave 57-81% C6F5CHROH but no sulfides.

AB The vigorous reaction of (C6F5)2CO with KCN in abs. EtOH at 20.degree. gave C6F5H, 2,3,5,6-F4C6HCN (I), C6F5CO2Et (II), 2,3,5,6,4-F4(EtO)C6CO2Et (III), and 2,3,5,6,7-F4(EtO)C6COC6F5 (IV). The compds. were sepd. by gas chromatog. and identified by NMR. The reaction of II with EtONa gave III.
Refluxing C6F5Br with EtONa in EtOH gave 2,3,5,6,4-F4(EtO)C6Br (V) which was converted to its Grignard compd. and reacted with C6F5CHO to give 2,3,5,-6,4-F4(EtO)C6CH(OH)C6F5, which on oxidn. with CrO3 gave IV. The reaction of C6F5COPh with KCN in EtOH at 75.degree. gave C6F5H, I, and 2,3,5,6,4-F4(EtO)C6COPh (VI). Reacting V with Mg and PhCHO in abs. Et2O gave 2,3,5,6,4-F4(EtO)-C6CH(OH)Ph which was oxidized to VI. The reaction of C6F5-COMe with KCN in EtOH at 60-70.degree. gave C6F5H, I, AcOEt, 2,3,5,6-F4C6HC(:NH)OEt (VII), 3,5,6,2-F3(EtO)C6HCN, and 2,3,5,6,4-F4(EtO)C6COMe (VIII). Treating V with Mg and Ac2O gave VIII. The treatment of VII with HCl in Et2O gave 2,3,5,6-F4C6HCONH2.

AB The substitution of the sterically hindered carbon of the potent **thyroid** hormone agonist, GC-1, was effected by a reaction based on the solvolysis of the benzylic hydroxyl group. The reaction was found to proceed in high yield with a variety of nucleophiles including alcs., thiols, allyl silanes and electron-rich arom. compds., providing a convenient route to the synthesis of new **thyroid** hormone analogs.

AB Several **thyroid** hormone analogs were tested for thyromimetic

activity on rat brain and liver subcellular organelles. The compds. were administered immediately after thyroidectomy to 90 g male rats for 10 days, by daily s.c. injection. In cerebral cortex and liver, the activities of mitochondrial succinate cycochrome c reductase [9028-10-8] and .alpha.-glycerophosphate dehydrogenase [9075-65-4] and nuclear RNA polymerase [9014-24-8] were measured. Brain mitochondrial enzymes were unchanged in thyroidectomized (Tx) and in Tx-treated rats, whereas the activities of these enzymes in liver mitochondria were partially restored by the treatments. RNA polymerase I activity in brain and liver dropped significantly 10 days after thyroidectomy and daily injection of **thyroid** hormones or analogs maintained the nuclear activity at a normal level. Correlation between the structure of **thyroid** hormone analogs and their subcellular effects is in good agreement with previous binding and in vivo studies. Enzyme activities stimulated by T3 [6893-02-3] were lowered by replacing the T3 side-chain by an acetic acid group or by substituting the bridged O atom by atom by CO. In contrast, the activity was enhanced by substituting I with a 3' iso-Pr group. Although less active than I, the 3,5-di-Me substituents may be introduced without a complete loss of nuclear activity.
